

Case Study

In this case study, a table and form editing application was designed and coded.

I have used Vue.js framework in this Project, because I like the development ecosystem of Vue and It's also lightweight and fast.

Furthermore, Vue.js provides us component-based structure to make the application more modular and manageable.

Json server was used for mock api.

To start the Project write the commands below:

- `npm install` → to download the dependencies
- `npm run dev` → to start the json-server and the project
